Type 4 integration (Whitelabeling)

Table of Contents

Note

Note

Make sure you have gone through the [Spintly Integration Overview](#) section, as that section will help you understanding the spintly platform and the types of integration

Examples of how to use type 2 with your

Use Case for Integration

In whitelabelling, the client doesn't have to do any development. In this integration spintly can whitelabel its app and spintly website with their logo and client theme color, the same can be done for gateways also. Also whichever integration mentioned before ie, type1, type2, and type3, will be available for the clients also.

There are two ways you can approach you can go with

1. Whitelabelling the spintly websites and apps, but cloud resides in spintly
2. Whitelabelling the spintly websites and apps, but you can have the spintly platform deployed to your own aws account

To get started please contact spintly help and support team [link](#)

embedding

white labeling

Table of Contents

Note

The features to be offered in this integration

Note

Make sure you have gone through the [Spintly Integration Overview](#) section, as that section will help you understanding the spintly platform and the types of integration. Please note the Type 5 integration will always go hand in hand with Type 3 integration. Also the below functionality are already available in [Spintly partner website](#) and [Spintly partner app](#). The functionality which are available in Spintly partner website is available via apis and functionalities which are available in spintly partner app are available as a sdk to the client. Please note if you are doing this integration you will need both the app and website, this integration can be used in below combination

1. Use Spintly Partner apis to create/delete devices gateways etc and use Spintly partner app to configure the devices
2. Use Spintly Partner apis to create/delete devices gateways etc and incorporate Spintly partner sdk in your app to configure the devices

Use Case for Integration

This integration is normally used when an existing access control client wants to integrate spintly devices with their platform, this integration normally goes hand in hand with type 3 integration

Live example:

This solution in combination with type 3 integration is already live and implemented by lot of our indian customers namely godrej

The features to be offered in this integration

Features	Available
----------	-----------

SPINTLY SAAMS API	NO
SPINTLY ACCESS SDK	NO
SPINTLY SAAMS APP	NO
SPINTLY SAAMS WEBSITE	NO
SPINTLY PARTNER WEBSITE/APP	YES
SPINTLY PARTNER SDK/API	YES

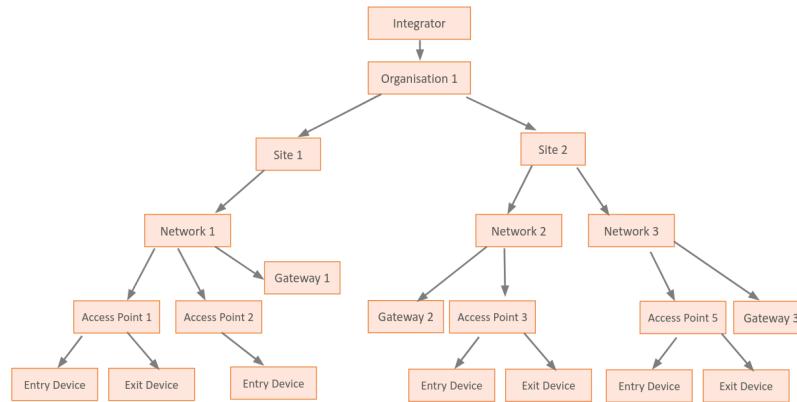

Steps to get up and running

As mentioned above Type 5 integration will always go hand in hand with Type 3, Type 5 integration cannot start

Please refer the following [link](#) to get up and running along with type 6 integration

Spintly Apis

Please keep the below diagram in mind while going through the apis

Following are the apis

1. Oauth apis
2. Create Organisations
3. Create Site
4. Delete Site
5. Create Network
6. Delete Network
7. Add Access point
8. Delete Access point
9. Add gateway

1) Oauth Api

Spintly uses oauth 2.0 client credential flow for authorization purpose, here in the api the client just has to put a clientId and clientSecret to get an access token, this access token can then be used to access other apis of Spintly.

The screenshot shows a POST request to <https://iot.api.spintly.com/identityManagement/v2/oauth/token>. The body contains the following JSON:

```

1 {
2   "grant_type": "urn:ietf:params:oauth:grant-type:client-credentials",
3   "client_id": "8614475f-078f-4d98-a5df-34d2c7478bab",
4   "client_secret": "c538ad76-7ea7-4b7f-8de7-e043abfbfec8"
5 }

```

The response status is 200 OK with a response body containing a long access token.

2) Create Organisation

Spintly uses oauth 2.0 client credential flow for authorization purpose, here in the api the client just has to put a clientId and clientSecret to get an access token, this access token can then be used to access other apis of Spintly. As shown in the spintly resources chart, when you create an organisation a site and a network under the site is created

REQUEST BODY

The screenshot shows a POST request to <https://iot.api.spintly.com/infrastructureManagement/integrator/v1/organisations>. The body contains the following JSON:

```

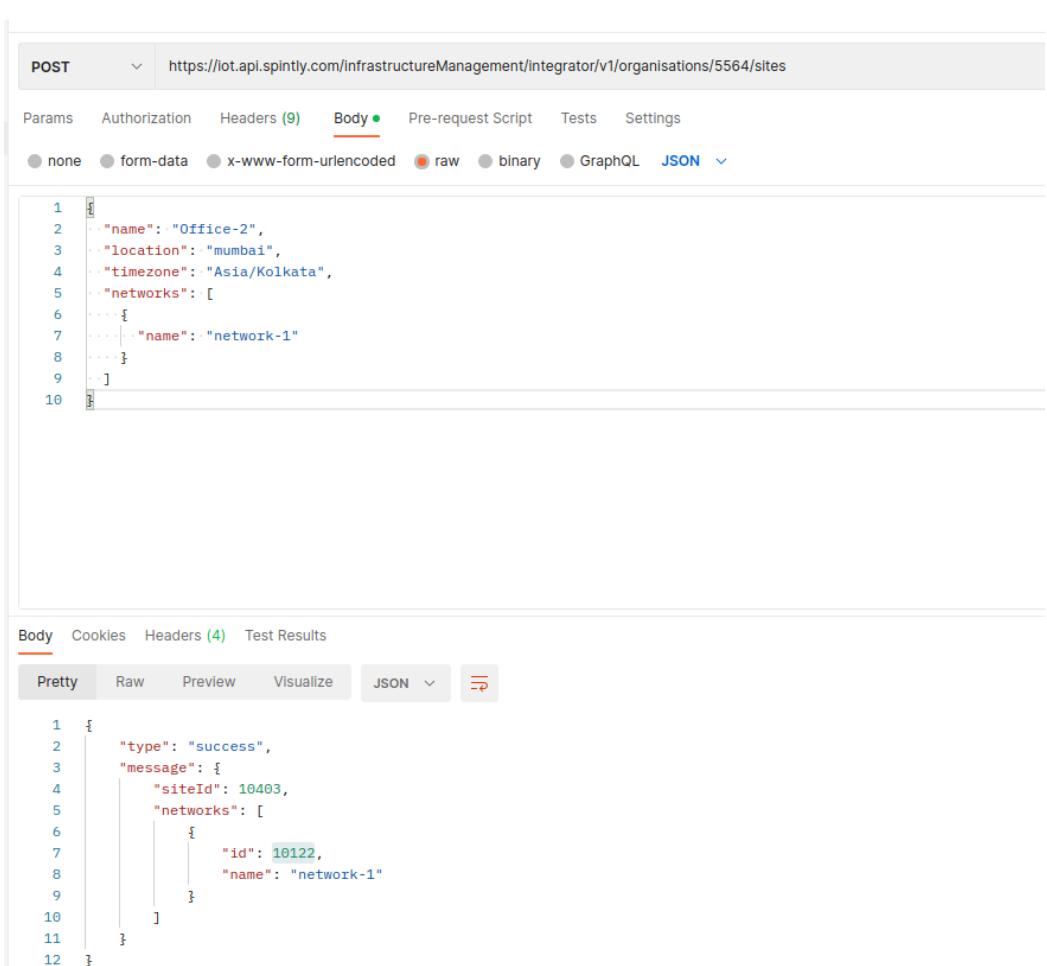

1 {
2   "integratorId": 79,
3   "name": "acme_tech",
4   "type": "office",
5   "accountType": "customer",
6   "country": "IN",
7   "admins": [
8     {
9       "name": "johndoe",
10      "phone": "+919876543210",
11      "email": "johndoe@example.com",
12      "adminType": 1
13    }
14  ],
15  "sites": [
16    {
17      "name": "Office-1",
18      "location": "Margao",
19      "timezone": "Asia/Kolkata",
20      "networks": [
21        {
22          "name": "test"
23        }
24      ]
25    }
26  ]
27 }

```

RESPONSE BODY

3) Create Site

This api is responsible for creating a new site under an organisations, this api needs to be called whenever client opens a new branch or center in a new location

```

POST https://iot.api.spintly.com/infrastructureManagement/integrator/v1/organisations/5564/sites
Body
{
  "name": "Office-2",
  "location": "mumbai",
  "timezone": "Asia/Kolkata",
  "networks": [
    {
      "name": "network-1"
    }
  ]
}
  
```

```

Pretty Raw Preview Visualize JSON
1 {
  "type": "success",
  "message": {
    "organisationId": 5564,
    "sites": [
      {
        "id": 10402,
        "name": "Office-1",
        "networks": [
          {
            "id": 10121,
            "name": "test"
          }
        ]
      }
    ]
  }
}
  
```

4) Delete Site

This api is responsible for creating a new site under an organisations, this api needs to be called whenever client opens a new branch or center in a new location

The screenshot shows a Postman interface with a DELETE request. The URL is <https://iot.api.spintly.com/infrastructureManagement/integrator/v1/sites/10139>. The Headers tab shows 7 items. The Body tab is selected, showing the option "raw". The response body is currently empty.

5) Create Network

This api is responsible for creating a new network under a site, say suppose there is 10 floor building, and the company has occupied two floors one on the 1st floor and one on the ninth floor, that time we create one network for 1st floor and one network we create for 9th floor

The screenshot shows a Postman interface with a POST request. The URL is <https://iot.api.spintly.com/infrastructureManagement/integrator/v1/sites/10403/networks>. The Headers tab shows 9 items. The Body tab is selected, showing the option "raw" and "JSON" dropdown set to "JSON". The raw JSON body is:

```

1 {
2   "name": "network-2"
3 }

```

The response body is shown in the JSON tab:

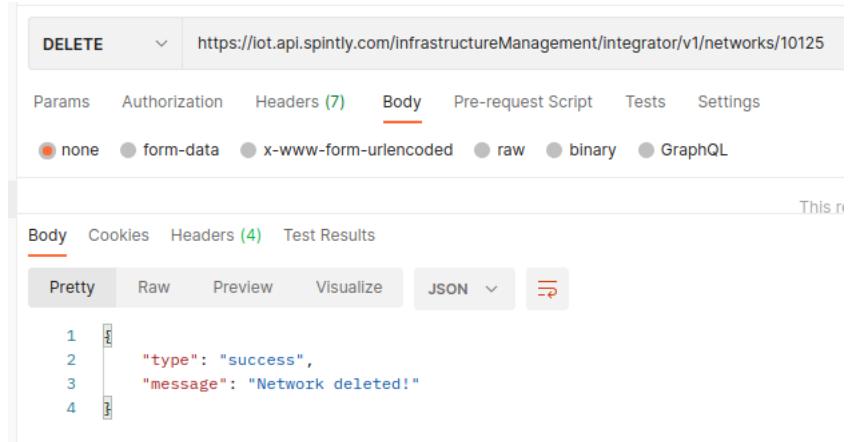

```

1 {
2   "type": "success",
3   "message": "Network with id 10125 created!"
4 }

```

6) Delete Network

This api is responsible for deleting existing network

The screenshot shows a Postman interface with a 'DELETE' request to the URL <https://iot.api.spintly.com/InfrastructureManagement/integrator/v1/networks/10125>. The 'Body' tab is selected, showing a JSON response with the following content:

```

1
2   "type": "success",
3   "message": "Network deleted!"
4

```

Add Access point

As mentioned in the "Spintly Software Resource" section, access point is nothing but a door, Spintly allows readers to be installed in different configurations:

1. Entry and Exit reader: if a door need entry as well as exit reader
2. Entry and REX: if door needs to have only an entry reader and one exit button (REX)
3. Clock-in device: In this configuration device is not attached to a door, it just attached to wall, this kind configuration is used for attendance purpose where employees can check in and checkout
4. Door Lock

Type of Configuration	Values to be put in the api
Entry and Exit reader	1
Entry and REX	2
Clock-in device:	5
Door Lock	6

Installation method: Here there are two kinds of installation method

1. New Install: This is a brand new installation method, where a reader needs to be attached to a new door
2. Retrofit Install: This kind of installation where an existing reader of another 3rd party is removed and instead Spintly reader is put

Installation method	Values to be put in the api
New Install	1
Retrofit type 1	2
Retrofit type 1	3

Locking mechanism: Here Spintly has the following locking mechanism

1. Door with mag lock
2. Door with strike lock
3. Boom barrier or Sliding gate

Locking mechanism	Values to be put in the api
Door with mag lock	1
Door with strike lock	2
Boom barrier or Sliding gate	3

Device Type

1. entry
2. exit
3. sc_controller
4. mc_controller

Device Type	Values to be put in the api
Entry	1
Exit	2
SC_controller	3
MC_controller	4

SerialNumber: All the readers have a serial number attached to it at the bottom, the user needs to enter the same when creating the access point

Please note once the access point is added, it can be in one of the following states

Status	Description	Can be assigned permissions to the user
create_pending	When a access point is created, the initial status will be always be "create_pending"	Cannot be used
ready_pending	This means the access point is created successfully, only that it needs to configured via spintly partner app	Cannot be used
alive_pending	Device is in process of getting configured	Cannot be used
in_sync	Access point is ready and can be used	Can be used
update_pending	Access point name is updated or some setting of access point is updated	Can be used
delete_pending	Here the Access point is in process of being deleted	Cannot be used

NOTE: Once the access points are added, the readers under the access points needs to be configured using the Spintly mobile based partner application

7a) Add Access point as entry and rex configuration

The screenshot shows a Postman interface with a POST request to <https://iot.api.spintly.com/infrastructureManagement/integrator/v1/networks/10122/accessPoints>. The Headers tab shows 9 items. The Body tab is selected and contains a JSON payload:

```
1 [ {  
2   "name": "door_1",  
3   "installationMethod": 1,  
4   "configuration": 2,  
5   "siteId": 10398,  
6   "networkId": 10117,  
7   "devices": [  
8     {  
9       "serialNumber": "1001FFFFE000205",  
10      "deviceType": 1  
11    }  
12  ],  
13  "lockingMechanism": 1,  
14  "relaySettings": {  
15    "relayOnTime": 6,  
16    "invertRelayLogic": false  
17  }  
18}  
19]  
20 ]
```

The Response tab shows a JSON response with 4 items:

```
1 {  
2   "type": "success",  
3   "message": {  
4     "accessPoints": [  
5       13913  
6     ]  
7   }  
8 }
```

7b) Add Access point as entry and exit configuration

POST https://iot.api.spintly.com/infrastructureManagement/integrator/v1/networks/10122/accessPoints

Body (9)

```

1  [
2   ...
3     {
4       "name": "door_2",
5       "installationMethod": 1,
6       "configuration": 1,
7       "siteId": 10398,
8       "networkId": 10117,
9       "devices": [
10      {
11        "serialNumber": "1001FFFFE000206",
12        "deviceType": 1
13      },
14      {
15        "serialNumber": "1001FFFFE000207",
16        "deviceType": 2
17      }
18    ],
19    "lockingMechanism": 1,
20    "relaySettings": {
21      "relayOnTime": 6,
22      "invertRelayLogic": false
23    },
24    "enableAttendance": false
25  ]

```

Body Cookies Headers (4) Test Results

Pretty Raw Preview Visualize JSON

```

1  {
2   "type": "success",
3   "message": {
4     "accessPoints": [
5       13914
6     ]
7   }

```

8) Add Controller

Adding of controller is similar to adding of access point. Spintly has 2 types of controller ie

1. Single door Controller
2. Two Door Controller

Spintly allows controller to be installed in different configurations:

1. Entry Reader + Door Controller
2. Door Controller + REX

Type of Configuration	Values to be put in the api
Entry Reader + Door Controller	3
Door Controller + REX	4

Locking mechanism: Here Spintly has the following locking mechanism

1. Door with mag lock
2. Door with strike lock

Locking mechanism	Values to be put in the api
Door with mag lock	1
Door with strike lock	2

8a) Add Single Door Controller as Door Controller + REX configuration

The screenshot shows a Postman interface with a POST request to <https://iot.api.spintly.com/infrastructureManagement/integrator/v1/networks/10122/accessPoints>. The request body is a JSON object representing a door controller configuration:

```
1  {
2  ...
3  "name": "door-one",
4  "installationMethod": 1,
5  "configuration": 4,
6  "lockingMechanism": 1,
7  "siteId": 10398,
8  "networkId": 10117,
9  "channelNo": 0,
10 "devices": [
11   {
12     "serialNumber": "1027FFFE00001D",
13     "deviceType": 3
14   }
15 ],
16 "RelaySettings": {
17   "relayOnTime": 6,
18   "invertRelayLogic": false
19 },
20 "enableAttendance": false
21 }
```

The response body is also a JSON object:

```
1  {
2    "type": "success",
3    "message": {
4      "accessPoints": [
5        13916
6      ]
7    }
8  }
```

8b) Add Single Door Controller as Entry Reader + Door Controller configuration

```

POST https://iot.api.spintly.com/infrastructureManagement/integrator/v1/networks/10122/accessPoints

Params Authorization Headers (8) Body Pre-request Script Tests Settings
none form-data x-www-form-urlencoded raw binary GraphQL JSON

1 [
2   {
3     "name": "ddddd",
4     "installationMethod": 1,

6     "lockingMechanism": 1,
7     "siteId": 10398,
8     "networkId": 10117,
9     "channelNo": 1,
10    "devices": [
11      {
12        "serialNumber": "1001FFFF0000203",
13        "deviceType": 1
14      },
15      {
16        "serialNumber": "102CFFFF000028",
17        "deviceType": 4
18      }
19    ],
20    "RelaySettings": {
21      "relayOnTime": 6,
22      "invertRelayLogic": false
23    },
24    "enableAttendance": false
25  }
26 ]

```

8d) Add Two Door Controller with two channel enabled

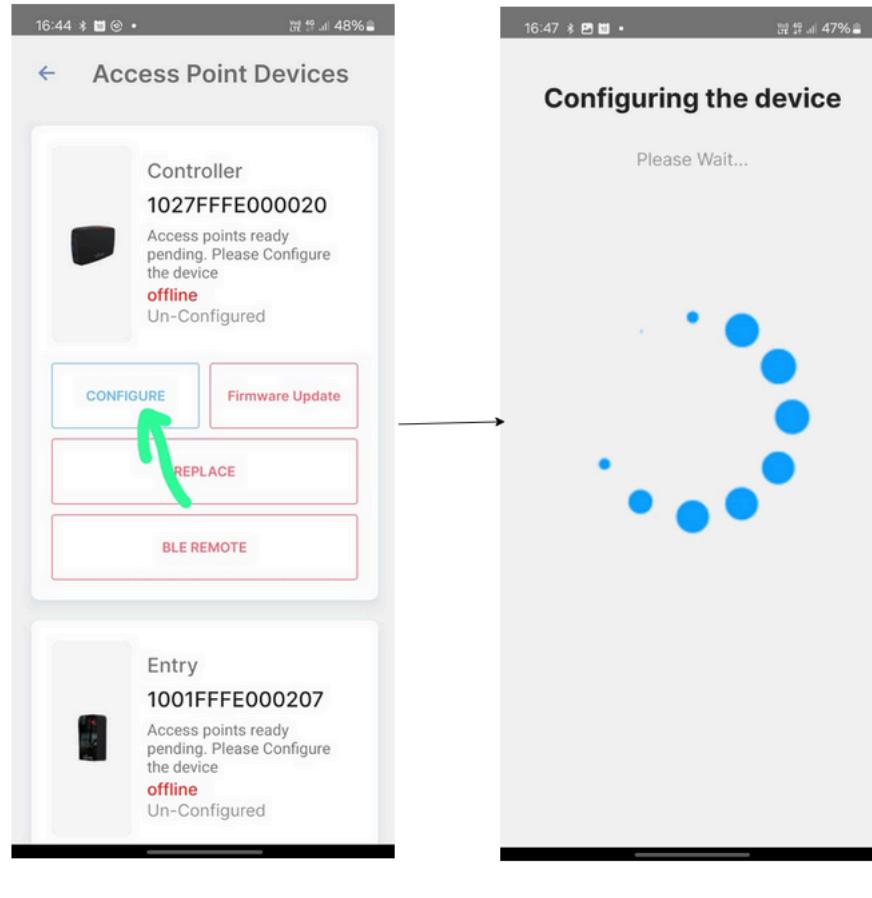

```

1 [
2   {
3     "name": "entry_reader",
4     "installationMethod": 1,
5     "configuration": 3,
6     "lockingMechanism": 1,
7     "siteId": 10398,
8     "networkId": 10117,
9     "channelNo": 1,
10    "devices": [
11      {
12        "serialNumber": "1001FFFE000203",
13        "deviceType": 1
14      },
15      {
16        "serialNumber": "102CFFFE000028",
17        "deviceType": 4
18      }
19    ],
20    "RelaySettings": {
21      "relayOnTime": 6,
22      "invertRelayLogic": false
23    },
24    "enableAttendance": false
25  },
26  {
27    "name": "exit_reader",
28    "installationMethod": 1,
29    "configuration": 3,
30    "lockingMechanism": 1,
31    "siteId": 10398,
32    "networkId": 10117,
33    "channelNo": 2,
34    "devices": [
35      {
36        "serialNumber": "1001FFFE000204",
37        "deviceType": 1
38      },
39      {
40        "serialNumber": "102CFFFE000028",
41        "deviceType": 4
42      }
43    ],
44    "RelaySettings": {
45      "relayOnTime": 6,
46      "invertRelayLogic": false
47    },
48    "enableAttendance": false
49  }
50 ]

```

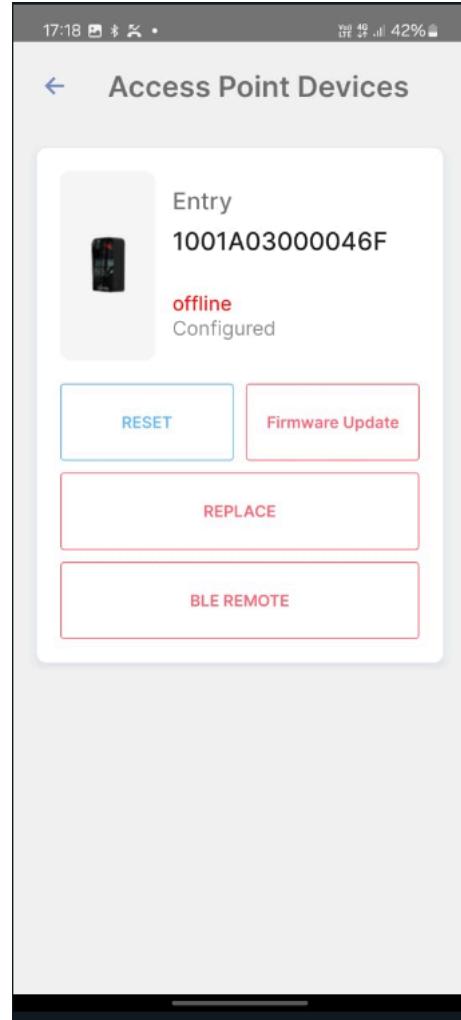

8e) Configuring the access point

Once the access point or controller is added, it needs to be configured using Spintly partner app

9) Delete Access point and Controller

Before deleting the access point/controller via the api we need to reset the devices under it using spintly partner app

Same api will be used to delete the access points and controller, please note delete of access point wont happen if the device is not reseted using the partner app

DELETE https://iot.api.spintly.com/InfrastructureManagement/integrator/v1/accessPoints/13917

Params Authorization Headers (9) Body • Pre-request Script Tests Settings

Body Cookies Headers (4) Test Results

Pretty Raw Preview Visualize JSON

```

1
2   "type": "success",
3   "message": "access point delete"
4

```

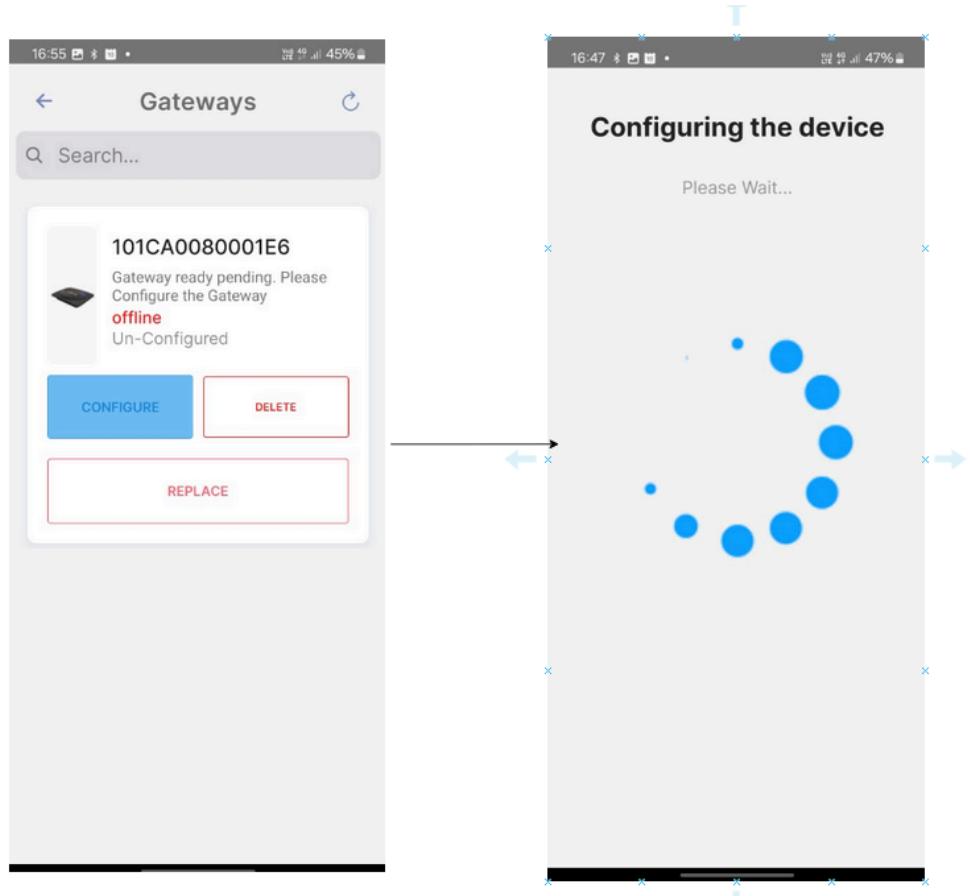

10) Add Gateway

This api is responsible for creating a new gateway, just like how a reader has a serial number will attached bottom of the gateway, just like the access point it needs to be under a network and it needs to be

configured using Spintly partner app

```
POST https://iot.api.spintly.com/infrastructureManagement/integrator/v1/networks/9873/gateways
Body (JSON)
{
  "serialNumber": "101CA0080001E6"
}
```

10e) Configure Gateway

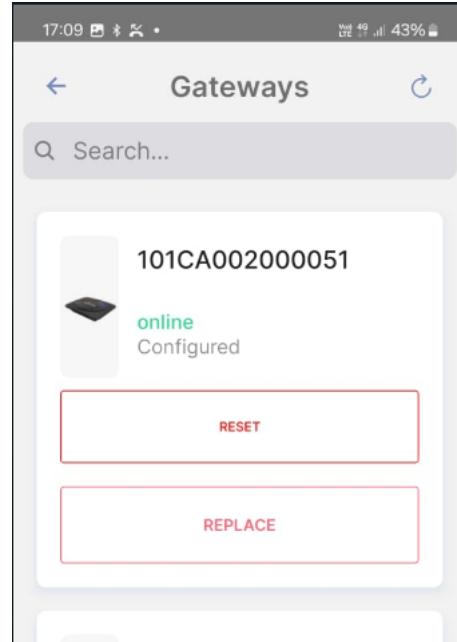

Related Articles

[Access Points](#)

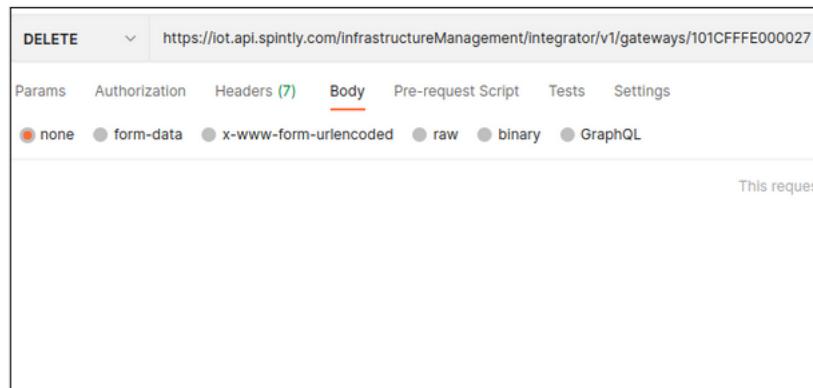

[Door Sensors](#)

11) Delete Gateway

Before deleting the gateway, we need to reset the gateway from the partner app, make sure the gateway is offline (ie disconnected to gateway)

This api is responsible for deleting a gateway, just make sure the gateway is first reseted using the Spintly partner app

Type 3 integration

Table of Contents

Note

The features to be offered in this integration

Note

Make sure you have gone through the [Spintly Integration Overview](#) section, as that section will help you understanding the spintly platform and the types of integration, This integration can be combined with type 5 integration

Use Case for Integration

This integration is normally used when a client just want to use Spintly access management service, how this is different from type 2 integration is in type 2 spintly apart from access management, also gives other modules like user management, visitor management, attendance management, and all its ui capabilities, In type 3 integration, the client gets apis only of the access management section.

Live example:

This solution is already live and implemented by lot of our Indian customers namely Godrej, So here the client had thier own website and app, with this integration the client included the spintly sdk in thier app, so with this app the client could open the doors, they also integrated spintly backend with thier own software, whenever a user is added or permissions were changed, spintly apis were called to create accessor and update the permissions and the same permission would reflect in the app via the sdk

The features to be offered in this integration

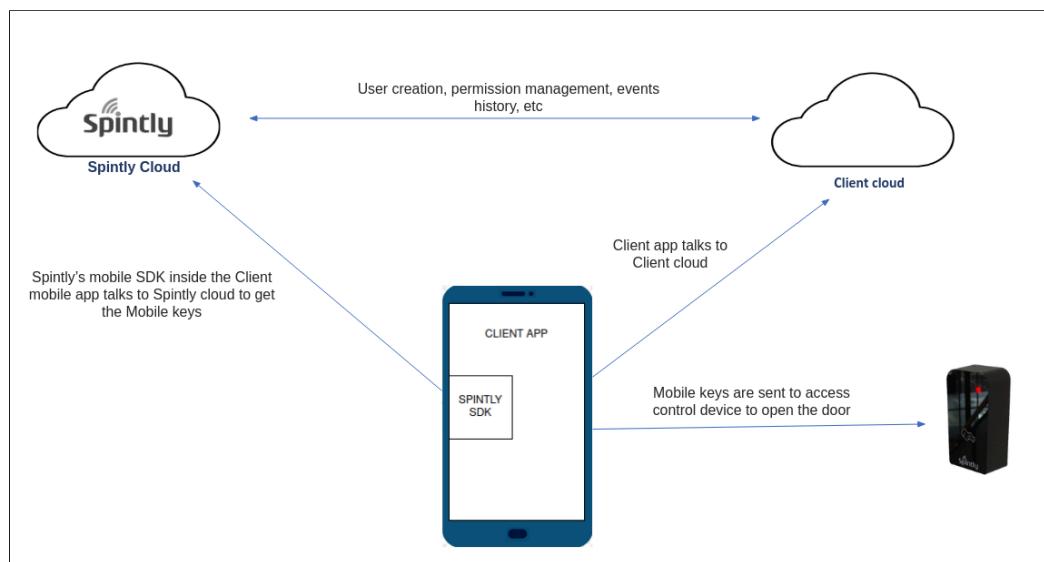

Features	Available
SPINTLY SAAMS API	YES
SPINTLY ACCESS SDK	YES
SPINTLY SAAMS APP	NO

SPINTLY SAAMS WEBSITE	NO
SPINTLY PARTNER WEBSITE/APP	YES
SPINTLY PARTNER SDK/API	YES(if type 5 integration is used)

Entities involved in this integration

As you can see in the below diagram, for type 3 integration to work the following entities will be needed, below are the entities involved:

1. Spintly Cloud: here different apis will be exposed which the client can use
2. Client Cloud: here the backend of the client will be hosted this backend will be responsible for talking to the client app
3. Spintly SDK: Here the spintly access sdk will be given to the client, client must include the sdk in its app, this will expose the functions which the client app can use to access the doors
4. Client app: This will be front facing app for the customer, apart from access client will be exposing different services
5. Spintly Reader: Once the user is logged in the client app, he can tap on the reader and open the door

Steps to get up and running

Please refer the following [link](#) to get up and running along with type 6 integration

please refer the following [link](#) to get up and running without any other integration

[Example](#) of how you can integrate type3 with your application

Mobile SDK

Please refer the following [link](#) to know in depth how to integrate the spintly access sdk

Following are the apis

1. Oauth apis
2. Get all sites
3. Get access points of a site
4. Create accessor
5. Get accessor permissions
6. Update accessor permissions
7. Get access point permissions
8. Update access point permissions

9. Assign Credential
10. Unassign Credential
11. Delete accessor

1) Oauth Api

Spintly uses oauth 2.0 client credential flow for authorization purpose, here in the api the client just has to put a clientId and clientSecret to get an access token, this access token can then be used to access other apis of Spintly.

```

POST https://iot.api.spintly.com/identityManagement/v2/oauth/token
Body (JSON)
{
  "grant_type": "urn:ietf:params:oauth:grant-type:client-credentials",
  "client_id": "8614d75f-078f-4d9b-a5df-3d42c74780ab",
  "client_secret": "c538ad76-7ea7-4b77-84e7-e043abfbec8"
}

```

Body (Pretty)

```

1   "access_token": "eyJhbGciOiJSUzI1NiIsInR5cCl61kpXCVJ9.eyJ29mZS16ImNsaVudHMH6YWxsIiwic3ViIjo5OSwiwF01joxNzMzNDA0NjIzLCJleHAiOjE3NDEx0A2MjN9.

```

2) Get Sites

This api is responsible for getting all the sites belonging to the Integrator, As you can see in the diagram

Params Authorization Headers (7) Body Pre-request Script Tests Settings

Type Bearer Token

The authorization header will be automatically generated when you send the request. Learn more about authorization

Token eyJhbGciOiJSUzI1NiIsInR5cCl61kpXCVJ9.eyJ29mZS16ImNsaVudHMH6YWxsIiwic3ViIjo5OSwiwF01joxNzMzNDA0NjIzLCJleHAiOjE3NDEx0A2MjN9.

Body (Pretty)

```

1   {
2     "type": "success",
3     "message": {
4       "sites": [
5         {
6           "id": 10742,
7           "name": "site_test_1",
8           "location": "site_loc",
9           "timezone": "Asia/Kolkata",
10          "address": "India"
11        }
12      ]
13    }
14  }

```

3) Get Access points

This api is responsible for getting all the access points(doors), that belong to a particular site

The screenshot shows a Postman interface with the following details:

- Request URL:** https://acaas.api.spintly.com/permissionManagement/v3/sites/10742/accessPoints
- Method:** GET
- Response Status:** 200 OK
- Response Time:** 427 ms
- Response Size:** 289 B
- Response Content (Pretty JSON):**

```

1  {
2   "type": "success",
3   "message": {
4     "accessPoints": [
5       {
6         "id": 14620,
7         "name": "test_Ap"
8       }
9     ]
10  }
11 }
```

4) Create Accessor

This api is responsible for creating an accessor(user), while creating the accessor, you will need to provide the organisation, you can also specify the permissions while creating the user(not mandatory, you can give permissions after creating the accessor also, you can check below few apis for the same), while giving permissions you can mention what kind of modes of permission the accessor can get ie mobile, card,fingerprint or face, in mobile there are more modes namely tap to access, click to access remote access etc, if Mobile access is given then the identity info needs to be present ie providerid(this will be provided by spintly) and sub(this is unique identifier which will be present in the jwt token which will be passed to the mobile access sdk). When the accessor is created it will give you an accessorid in the response which needs to be mapped to the userid in your software/backend

Modes Of access

- Mobile
- Card
- Finger Print
- Face

Modes of Mobile Access

- Tap To Access
- Click To Access
- Remote Access

Request Body

The screenshot shows a Postman interface with the following details:

- Method:** POST
- URL:** <https://acaas.api.spintly.com/permissionManagement/v6/accessors>
- Body (JSON):**

```

1  {
2   "orgId": 5733,
3   "credentialId": null,
4   "permissionsToAdd": [
5     {
6       "accessPointId": 4059,
7       "mobile": {
8         "enabled": true,
9         "settings": {
10           "tapToAccess": true,
11           "clickToAccessRange": 1,
12           "remoteAccess": true,
13           "mfaEnabledRemoteAccess": true,
14           "mfaEnabledClickToAccess": true
15         }
16       },
17       "card": {
18         "enabled": true
19       },
20       "fingerprint": {
21         "enabled": true
22       },
23       "face": {
24         "enabled": true
25       }
26     ],
27     "identityInfo": {
28       "provider": "d9a42177-6f45-408e-9b8c-3bdd190c7d2a",
29       "sub": "archit1"
30     }
31   }
32 }
```

Response

The response body is displayed in JSON format:

```

1  {
2   "type": "success",
3   "message": {
4     "id": 576328
5   }
6 }
```

5) Get accessor permissions

This api is responsible for getting all the access point permissions of the accessor

The screenshot shows a Postman interface with the following details:

- Method:** GET
- URL:** https://acaas.api.spintly.com/permissionManagement/v3/organisations/5733/accessors/576328/permissions
- Headers:** (7) (highlighted)
- Body:** (highlighted)
- Params:** none
- Authorization:** (highlighted)
- Body Content:**

```

1 "type": "success",
2 "message": {
3     "permissions": [
4         {
5             "accessPointId": 14620,
6             "permissionRemoved": false,
7             "status": "pending",
8             "mobile": {
9                 "enabled": true,
10                "status": "in_sync",
11                "settings": {
12                    "proximityAccess": false,
13                    "tapToAccess": true,
14                    "clickToAccessRange": 2,
15                    "remoteAccess": false,
16                    "mfaEnabledRemoteAccess": false,
17                    "mfaEnabledClickToAccess": false
18                }
19            },
20            "card": {
21                "enabled": true,
22                "status": "add_pending"
23            },
24            "fingerprint": {
25                "enabled": false,
26                "status": "in_sync"
27            },
28            "face": {
29                "enabled": false,
30                "status": "in_sync"
31            }
        }
    }
}

```

6) Update accessor permissions

This api is responsible for updating the accessor permissions, in the permissionsToAdd you can specify what access point permission to give. Here the request body is similar to create accessor. In the permissionsToRemove you can specify the permissions to be removed. Please note you cannot add and remove the same access point permissions at the same time. The below combinations are allowed.

1. Updating only permissionsToAdd

PATCH https://acaas.api.spintly.com/permissionManagement/v2/organisations/5733/accessors/576328/permissions

Params Authorization Headers (9) Body Pre-request Script Tests Settings

none form-data x-www-form-urlencoded raw binary GraphQL JSON

```

1 {
2   "permissionsToAdd": [
3     {
4       "accessPointId": 14620,
5       "mobile": {
6         "enabled": true,
7         "settings": {
8           "proximityAccess": false,
9           "tapToAccess": true,
10          "clickToAccessRange": 2,
11          "remoteAccess": false,
12          "mfaEnabledRemoteAccess": false,
13          "mfaEnabledClickToAccess": false
14        }
15      },
16      "card": {
17        "enabled": true
18      },
19      "fingerprint": {
20        "enabled": false
21      }
22    ],
23   "permissionsToRemove": [
24     ]
25 }
26

```

2) Updating only permissionsToRemove

PATCH https://acaas.api.spintly.com/permissionManagement/v2/organisations/5733/accessors/576328/permissions

Params Authorization Headers (9) Body Pre-request Script Tests Settings

none form-data x-www-form-urlencoded raw binary GraphQL JSON

```

Body Cookies Headers (6) Test Results

Pretty Raw Preview Visualize JSON

```

1  {
2    "type": "success",
3    "message": {
4      "permissions": [
5        {
6          "accessorId": 577574,
7          "mobile": {
8            "enabled": true,
9            "settings": {
10              "proximityAccess": false,
11              "tapToAccess": true,
12              "clickToAccessRange": 2,
13              "remoteAccess": false,
14              "mfaEnabledRemoteAccess": false,
15              "mfaEnabledClickToAccess": false
16            }
17          },
18          "card": {
19            "enabled": true
20          },
21          "fingerprint": {
22            "enabled": false
23          },
24          "face": {
25            "enabled": false
26          }
27        },
28      ]
29    }
30  }
```

8) Update access point permissions

This api is responsible for updating all the accessors on a particular access point. Please note this api may look similar to update accessor permissions api, only difference is there for particular access you can give different access point permissions, whereas in this api for a particular access point you can give permissions to different accessors. Please note you cannot add and remove the same access point permissions at the same time. Like update accessor permissions api, here also different combination are allowed:

1.

```

PATCH https://acaas.api.spintly.com/permissionManagement/v2/organisations/5733/accessPoints/14620/permissions

```

10) Unassign Card Api

This api is responsible for unassigning a card of an accessor

DELETE https://stage1.acaas.api.spintly.com/permissionManagement/v2/organisations/1195/accessors/32099/credential

Params (Query Params)

KEY	VALUE
Key	Value

11) Delete Accessor Api

This api is responsible for deleting an accesser

The screenshot shows a Postman interface with the following details:

- Method:** DELETE
- URL:** https://stage1.acaas.api.spintly.com/permissionManagement/v3/Accessor/139691
- Headers:** (7)
- Params:** (This tab is selected)
- Query Params:** A table with columns KEY and VALUE. It has one row with Key and Value both set to 'Key'.
- Body:** (Not visible in the screenshot)
- Pre-request Script:** (Not visible in the screenshot)
- Tests:** (Not visible in the screenshot)
- Settings:** (Not visible in the screenshot)

12 User Schedule

12a) Create Schedule

This api is responsible for creating user schedule, Steps how to get user schedule working are as followed

1. You need to first create a schedule
2. Create an accessor and assign the accessor permissions
3. Assign the user schedule

The request body of create schedule has the following

name: When creating a schedule, please make sure a meaningful name is given

sections: Here in this section you can specify what will be settings of the schedule for each day of the week

repeatType: In sections, there will be field called as repeatType, it has two value ie once or weekly, once means if the schedule needs to be triggered once only, if it once you need specify the date when it will get triggered. weekly means the schedule will get always triggered every week

daysOfWeek: In section, there will be field called as daysOfWeek. Here you need to specify the days in integer format, below are the values

Day	Value
Monday	1
Tuesday	2
Wednesday	3
Thursday	4
Friday	5
Saturday	6
Sunday	7

Triggers: In section, there will be a field called as triggers, triggers basically tell which time section the door should deny access to the user and when the door should grant access to the user, it has two fields ie state and time, The time field you can either specify in minutes or in hours and below are the values for the same

State
deny
allow

Once a schedule is created it will give a scheduleId and different sectionId. When creating a schedule it is mandatory to put the holiday section also(ie christmas 25th December, new years 1st January), the holiday section will always overwrite the existing schedule

Please check the below section how you can use the above in an api

- a) Creating a user schedule from 9am to 6pm for the all the days of the week (Case 1) and also specifying the holidays also (25th dec)

Below is how the requestBody will look like, here the triggers section states that from 00:00 to 9:00 the user will be getting access denied, from 9:00 to 17:00 the access will be enabled for the user and from 17:00 to 23:59 the user will be getting access denied

```
POST https://us.acaas.api.spintly.com/permissionManagement/v1/organisations/654/schedules/user

Params Authorization Headers (9) Body Pre-request Script Tests Settings

- a) Creating a user schedule from 9am to 5pm for Monday, and 6am to 1pm for the other days (Case 2)

Below is how the `requestBody` will look like, as you can see there are 2 entries in the sections, on entry has the setting only for monday schedule, where as the second section has settings for Tuesday,Wednesday, Thursday, Friday and Saturday. Here mondays trigger section states that from 00:00 to 9:00 the user will be getting access denied, from 9:00 to 17:00 the access will be enabled for the user and from 17:00 to 23:59 the user will be getting access denied. Whereas for the rest of the week the second section states that from 00:00 to 06:00 the user will be getting access denied, from 06:00 to 13:00 the access will be enabled for the user and from 13:00 to 23:59 the user will be getting access denied.

59      }
60    ]
61  }

```

As you can see above each week of a day can have its own schedule, it all depends on a companies use, some company may want to have the same schedule for all the days of the week, some companies may want to have different schedule for all different days of the week. Basically there can be different permutation and

combination of the schedules. but whenever a schedule is created all the days of the week need to be specified, otherwise schedules cannot be created

When a schedule is created, the api will always give a schdeuleid and sectionids(depending on how many schedules are created), below are the response for the above two cases

Case1 response

Basically it will return you the same thing what you had mentioned in the requestbody, only for few things, it will return a scheduleId(highlighted in blue) and sectionId(highlighted in red), this values are important, as using the ids you can update or delete the schedule accordingly

Case2 response

It will return a response identical to case1, but since in case 2 there were different sections, it will return you two section ids, for explanation sake , the response has been minimized, here the red arrow indicates section 1 id (ie of mondays) and orange arrow indicates section 2 id (ie of Tuesdays, Wednesdays, thursdays, Fridays and aturdays)

12b) Getting all the user schedules of an organisations

This api is responsible for getting all the schedule for the organisaitons

12c) Getting details of a particular schedule in depth

This api is responsible for getting details of a particular schedule

12d) Updating an existing schedule

This api is responsible for getting updating existing schedules, here lets try to update the schedule already created in the create schedule section, pleas refer case1 and case 2 of create schedule for more context

case 1 updating

Say you wan to update the end tie for case 1 from 17:00 to 19:00, then the reuquest body will look like below, as you can see below the scheduleId(marked as organe) in the url is the same id which we got while creating the first schedule. In the request body there is a field called as update, the update is nothing but the sectionid which you need to update,

case 2 updating

Case 2 updating is the same as case 1 updating, only different is, in case 2 there were 2 sections created, you can either update both the sections o update only one section

updating 2 sections on an existing schedules, as you can see you need to specify both the section ids(red and orange) if you want to update both

12e) Deleting an existing schedule

This api is responsible for deleting an existing schedules, as you can see you just need to specify the orgid and scheduleid

[Organization Settings](#)

12f) Assigning schedule to an accessor

This api is responsible for assigning a schedule to an accessor, here you can specify which all accessors needs to given the schedule, also it needs to tell which access point the schedule needs to be applied. Multiple schedules cannot be assigned on the same door as of now

12g) Unassigning schedule to an accessor

This api is responsible for unassigning a schedule to an accessor, here you can specify which all schedules needs to be removed from an accessor

12i) Get the schedules assigned to a user (accessor filter)

This api is responsible for getting all permissions of an accessor and showing which all access points has schedule assigned and which all access point has schedule unassigned

12i) Get the schedules assigned to a user (access point filter)

This api is responsible for getting all permissions of an access point and showing which all access points has schedule assigned and which all access point has schedule unassigned

Use Case for Integration

Live example:

The features to be offered in this integration

Spintly Apis

Use Case for Integration

This integration is normally used when a client already have its own website, and wants to automate granting of accesses

Example: Say you own company called as acme, acme has its own website. When a user joins acme company, the hr has to go to the acme website create user and then go to Spintly website and add user, imagine if there were 1000 users, this can be cumbersome for the Hr. To solve this problem, ACME can integrate using Spintly apis, where whenever a new user is created, ACME software can call Spintly apis to create user. Also the admin can mark certain doors as default doors which whenever a user is added, he will get the door permission by default without the admin manual intervention. Same thing can be done with update and delete. So during month end , the admin can go to the Spintly dashboard and download all kinds of user reports which can help the efficiency of the organisation

Live example:

This solution is already live and implemented by a client called as ff21. More about FF21 below

FF21 offers best-in-class **co-living spaces** with a strong focus on **experience design, community and technology**. We currently operate over a 1000+ beds in Bangalore. At the core of FF21, is to create safe and fun spaces for the young millennials who are new to the city and provide the right environment *Where Friends Become Family*. The FF21 brand, is wholly owned and operated by Sherwood Longstay Pvt Ltd.

So with this solution ff21 has automated granting of access and has made life easier for the ff21 staff.

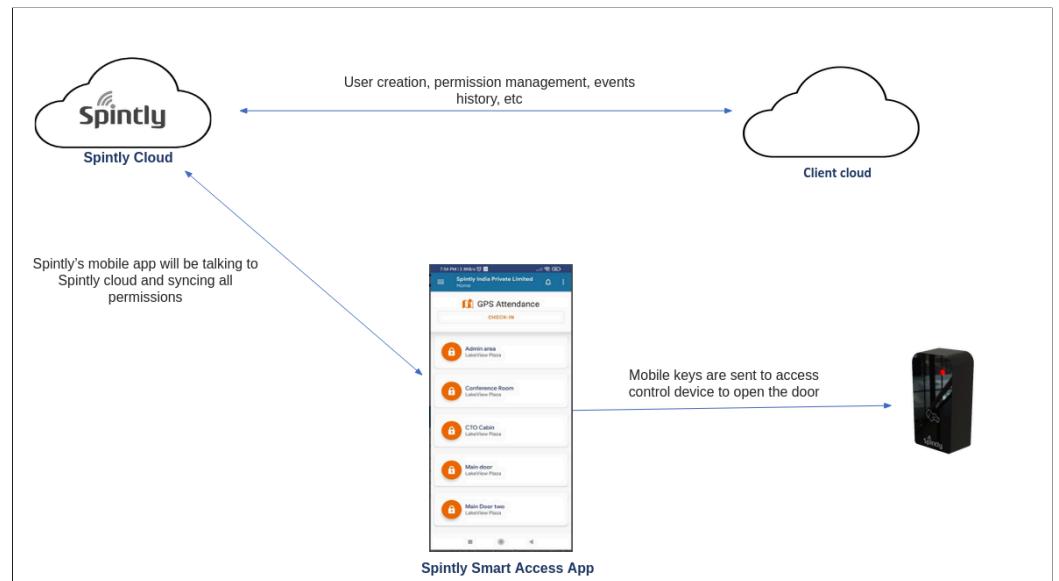

The features to be offered in this integration

Features	Available
SPINTLY SAAMS API	YES
SPINTLY ACCESS SDK	NO
SPINTLY SAAMS APP	YES
SPINTLY SAAMS WEBSITE	YES
SPINTLY PARTNER WEBSITE/APP	YES
SPINTLY PARTNER SDK/API	NO

Entities involved in this integration

As you can see in the below diagram, for type 3 integration to work the following entities will be needed, below :

1. Spintly Cloud: here different apis will be exposed which the client can use
2. Client Cloud: here the backend of the client will be hosted this backend will be responsible for talking to the
3. Spintly Smart access app: with this app the user will be able to access the doors
4. Spintly Reader: Once the user is logged in the client app, he can tap on the reader and open the door

Steps to get up and running

Please refer the following [link](#) to get up and running

Simple example on how to do changes in your backend/cloud is shown [here](#)

Spintly Apis

Spintly provides different apis so that another software can seamlessly integrate with spintly
Following are the apis spintly provides

1. OAuth token api
2. Get sites
3. Get Access points
4. Get organisation roles
5. Create a new user
6. Update a user
7. Deactivate a user
8. Activate a user
9. Delete a user
10. Get organisation user list
11. Get user permissions

12. Get all users who have permission assigned to a door

13. Modify permissions of a user

1. Oauth Api

Spintly uses oauth 2.0 client credential flow for authorization purpose, here in the api the client just has to put a clientId and clientSecret to get an access token, this access token can then be used to access other apis of Spintly.

The screenshot shows a Postman request to <https://saams.api.spintly.com/samsdm/oauth/token>. The method is POST. The Body is in JSON format:

```

POST https://saams.api.spintly.com/samsdm/oauth/token
{
  "client_id": "981ead09-3e2e-4bad-93a4-4c3e8d09a6",
  "client_secret": "1a1e173e-2e6d-4fe4-8fb5-0fb77e9b399",
  "grant_type": "urn:ietf:params:oauth:grant-type:client-credentials"
}

```

The response status is 200 OK, with a response body containing the access token and other details:

```

{
  "type": "success",
  "message": "Success",
  "payload": {
    "access_token": "eyJhbGciOiJIUzI1NiBhcHBsaWNvbnNlfkxIiJ9.eyJzdWIiOiIxMjM0NTYwNDQ0MC4xNC4yMjIiLCV1I21bD0TAC3PyWUfDRSPG0h4aHrThCn4GCI9MfPfIgsNTgE9M8tHViXh0xZedC8-Ivv-Lsp-rgBlaN0iNvysP0oR9PPlgNv1z211mKqTRzisqkX1KTzbwUl-wCD3BVA6dJ115g38Neu13nX0uRaL4SpFyV...",
    "refresh_token": "ya2MAMN-A2z31Q04-0L0100583CH10MP7BMs153uadM5aSe141Rba4KcAC_123170B100u8d01f2m7oHvxxkFpERQkhsNCM0Hd1c1p1i2325d1uvowMeMdz-5caXkyLs4h8KeyYNg1e0zg2jZ0j39PrVVy-0P1pOoJ22M6d4kcc-qJqJew_LF42f20f3PF9dzdA3177Wv-eG10n.Tzv6Gau1132P75d3hAg0p71j5JtneOzcrmpf1Ag6QmVCT2byxHDQfC_MeQ3U81kRPlCfrfIjt",
    "token_type": "bearer",
    "expires_in": 7776000,
    "issued_token_type": "urn:ietf:params:oauth:token-type:jwt"
  },
  "statusCode": 200
}

```

2) Get Sites

This api is responsible for getting all the sites belonging to the organisation, As you can see in the diagram, If there multiple site, spintly provides pagination support also

The screenshot shows a Postman request to <https://saams.api.spintly.com/organisationManagement/v2/integrator/organisations/5125/sites>. The method is POST. The Body is in JSON format:

```

POST https://saams.api.spintly.com/organisationManagement/v2/integrator/organisations/5125/sites
{
  "pagination": {
    "page": 1,
    "perPage": 40
  }
}

```

The response status is 200 OK, with a response body containing the sites data:

```

{
  "type": "success",
  "message": {
    "sites": [
      {
        "id": 9483,
        "name": "TEST Goa",
        "location": "Goa",
        "createdAt": "2024-05-27T13:15:56.721Z",
        "updatedAt": "2024-05-27T13:15:57.665Z"
      }
    ]
  }
}

```

2) Get Access points

This api is responsible for getting all the access points(doors), that belong to a particular site, like the previous site apis, Spintly provides pagination support if there multiple sites, also Spintly will provide filter support where user can search by access point names

```

POST https://saams.api.spintly.com/organisationManagement/v1/integrator/organisations/1036/sites/6213/accessPoints/list

23            "startDateTime": null,
24            "endDateTime": null

```

2) Get Organisation roles

Before creating a user, you need to all the roles belonging to the organisations, Spintly has different roles

1. Spintly user
2. Site admin
3. Super admin
4. Front Desk role(if visitor management module is enabled)
5. Manager role(if attendance module is enabled)

```

  ]
}
  
```

2) Get User Permissions

This api is responsible getting the permissions of a user, it returns 3 things

- 1) permissionAssigned: this are permissions currently assigned to the user
- 2) permissionNotAssigned: this are permissions not assigned to the user
- 3) pendingPermissions: this are permissions which users have but not reached to the device yet

```

POST https://saams.api.spintly.com/accessManagementV3/integrator/v1/organisations/1036/users/119383/permissions
Headers (application/json)
Content-Type
Content-Length
Host
User-Agent
Accept
Accept-Encoding
Connection
Authorization
Body (Pretty)
{
  "type": "success",
  "message": {
    "permissionAssigned": [
      {
        "id": 11355,
        "name": "GA_SF_MAIN_DOOR",
        "siteName": "Lake View Plaza_SF",
        "siteId": 6213,
        "pendingPermission": false,
        "pendingReason": "Card assignment pending"
      },
      {
        "id": 9692,
        "name": "5F Main Door Lock",
        "siteName": "Lake View Plaza_SF",
        "siteId": 6213,
        "pendingPermission": false,
        "pendingReason": "Card assignment pending"
      }
    ]
  }
}
  
```

2) Update user permissions

This api is responsible for assigning and unassigning permissions of a user

```

PATCH https://saams.api.spintly.com/accessManagementV3/integrator/v1/organisations/1036/users/119383/permissions
Body (JSON)
{
  "permissionsToAdd": [],
  "permissionsToRemove": []
}
  
```

2) Card Assignment

This api is responsible for assigning a card to a user

```
PATCH https://saams.api.spintly.com/accessManagementV3/integrator/v1/organisations/1036/users/119383/assignCredential

Params Authorization Headers (9) Body Pre-request Script Tests Settings
none form-data x-www-form-urlencoded raw binary GraphQL JSON
1 {"credentialId": "1234567890"}
```

2) Card Unassignment

This api is responsible for unassigning a card to a user

```
DELETE https://saams.api.spintly.com/accessManagementV3/integrator/v1/organisations/1036/users/119383/unassignCredential

Params Authorization Headers (7) Body Pre-request Script Tests Settings
none form-data x-www-form-urlencoded raw binary GraphQL
This request does not have a body
```

Note

The features to be offered in this integration

Spintly Apis

Note

Make sure you have gone through the [Spintly Integration Overview](#) section, as that section will help you understanding the spintly platform and the types of integration

Use Case for Integration

This integration is normally used when a client already has its own app and the client wants the Spintly SDK to be in its own app rather than using spintly app to give access, with this approach the end customer thinks the client has implemented the access control functionality, it also prevents the end customer from using two apps i.e. client app for client facilities and spintly app for access, thus enabling seamless experience to the end customer.

Live example:

This solution is already live and implemented by lot of our Indian customers namely, smartworks, cowrks, anarock, nucleus etc

The features to be offered in this integration

Features	Available
SPINTLY SAAMS API	YES
SPINTLY ACCESS SDK	YES
SPINTLY SAAMS APP	NO
SPINTLY SAAMS WEBSITE	YES
SPINTLY PARTNER WEBSITE/APP	NO

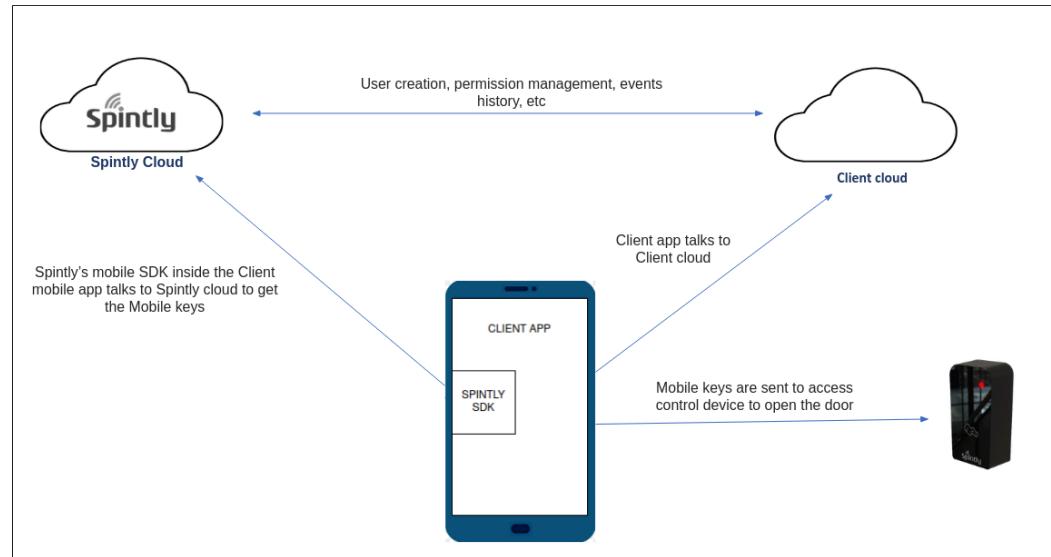

SPINTLY PARTNER SDK/API

NO

Entities involved in this integration

As you can see in the below diagram, for type 3 integration to work the following entities will be needed, below :

1. Spintly Cloud: here different apis will be exposed which the client can use
2. Client Cloud: here the backend of the client will be hosted this backend will be responsible for talking to the spintly cloud
3. Spintly SDK: Here the spintly access sdk will be given to the client, client must include the sdk in its app, this will expose functions which the client app can use to access the doors
4. Client app: This will be front facing app for the customer, apart from access client will be exposing different services
5. Spintly Reader: Once the user is logged in the client app, he can tap on the reader and open the door

Steps to get up and running

Please refer the following [link](#) to get up and running along with type 6 integration

Simple example on how to do changes in your backend/cloud is shown [here](#)

Mobile SDK

Please refer the following [link](#) to know in depth how to integrate the spintly access sdk

Spintly Apis

Spintly provides different apis so that another software can seamlessly integrate with spintly
Following are the apis spintly provides

1. Oauth token api
2. Get sites
3. Get Access points
4. Get organisation roles
5. Create a new user
6. Update a user
7. Deactivate a user
8. Activate a user
9. Delete a user
10. Get organisation user list
11. Get user permissions
12. Get all users who have permission assigned to a door
13. Modify permissions of a user

1. Oauth Api

Spintly uses oauth 2.0 client credential flow for authorization purpose, here in the api the client just has to put a clientId and clientSecret to get an access token, this access token can then be used to access other apis of Spintly.

```
POST https://saams.spintly.com/oauth/token
{
  "client_id": "891ead75-162d-dba8-81b8-fcfd8db923bba",
  "client_secret": "1c1e17e2e-24d4-44ea-b0d9-d5e70709bc399",
  "grant_type": "urn:ietf:params:oauth:grant-type:client-credentials"
}

{
  "type": "success",
  "message": {
    "payload": {
      "access_token": "eyJhbGciOiJSUzI1NiIzIwRic2IwIxpXCV29...",
      "token_type": "bearer",
      "expires_in": 7776000,
      "issued_token_type": "urn:ietf:params:oauth:token-type:jwt",
      "status_code": 200
    }
  }
}
```

2) Get Sites

This api is responsible for getting all the sites belonging to the organisation, As you can see in the diagram, If there multiple site, Spintly provides pagination support also

```
POST https://saams.spintly.com/organisationManagement/v2/integrator/organisations/5125/sites ...
{
  "pagination": {
    "page": 1,
    "perPage": 40
  }
}

{
  "type": "success",
  "message": {
    "sites": [
      {
        "id": 9483,
        "name": "TEST Goa",
        "location": "Goa",
        "createdAt": "2024-05-27T13:15:56.721Z",
        "updatedAt": "2024-05-27T13:15:57.665Z"
      }
    ]
  }
}
```

2) Get Access points

This api is responsible for getting all the access points(doors), that belong to a particular site, like the previous site apis, Spintly provides pagination support if there multiple sites, also Spintly will provide filter support where user can search by access point names

```

POST https://saams.api.spintly.com/organisationManagement/v1/integrator/organisations/1036/sites/6213/accessPoints/list
Body (9) Body
Params Authorization Headers (9) Body Pre-request Script Tests Settings
none form-data x-www-form-urlencoded raw binary GraphQL JSON
1
2 "sites": []
3

          "endDateTime": null
        }
      ]
    }
  ]
}

```

2) Get Organisation roles

Before creating a user, you need to know all the roles belonging to the organisations, Spintly has different roles

1. Spintly user
2. Site admin
3. Super admin
4. Front Desk role(if visitor management module is enabled)
5. Manager role(if attendance module is enabled)

      },
      "deactivateUser": false
    }
  ]
}

```

2) Create User

This api is responsible for creating a user in Spintly, when creating the user, you can specify what kind of roles the user gets, what kind of door permissions the user gets, what kind of mode of access the user can have etc. Once the user is created Spintly returns the id of the user

```

POST https://saams.api.spintly.com/userManagement/integrator/v1/organisations/5809/users/create
